

Course Title	Research Project			
Course Code	MED-405			
Course Type	Required			
Level	Undergraduate			
Year / Semester	Year 4/ Semester 7 (Fall)			
Teacher's Name	Course Lead: Dr Constantina Constantinou			
ECTS	6	Lectures / week	2	Laboratories / week 0
Course Purpose and Objectives	<p>As progress in evidence-based medicine is driven by research, it is imperative that research is integrated in the curriculum of all medical schools. Through their engagement in research projects, students develop the ability to analyse and critically appraise published research articles as well as to develop important research skills which will help them succeed in academia and clinical practice. Furthermore, an early exposure with research will help students decide whether they would like to progress to/ combine a career in academic research following the completion of their MD degree.</p> <p>The MED-405 Research Project course offers students the opportunity to either:</p> <p>(a) Carry out a Narrative Literature Review. By carrying out a Narrative Literature Review, students study in depth a topic outside the core curriculum and develop critical thinking and self-directed learning skills. Students carry out a literature review and write a 4000-word self-directed Narrative Literature Review on specific disorders under the four main non-communicable disorders (Cardiovascular disease, cancers chronic respiratory diseases and diabetes). The students familiarise themselves with the process involved in carrying out a narrative literature review for journal publication and/or for developing research hypotheses that could develop into research proposals and research projects. Students are encouraged to embrace this opportunity and enrich their medical education through not only the development of a high-quality Narrative Literature Review that is a requirement of the current course but also through the pursuit of a publication in an academic journal.</p> <p>or</p> <p>(b) Carry out a Research Project and develop a Research Poster. By carrying out an original Research Project, students study a topic outside the core curriculum in depth and develop critical thinking and self-directed learning skills. Students carry out a project that involves data collection/ extraction (e.g. by using questionnaires, databases etc) and qualitative or quantitative analysis of results. The performance of lab-based projects may also be possible. The data collection/ extraction and analysis familiarise students with the process involved in carrying out an original research project. The outcome of the research project is the development of a scientific poster that meets the published assessment criteria of scientific conferences, written in plain English and accessible by a general professional audience including healthcare professionals, researchers and medical educationalists. Students are encouraged to embrace this opportunity and enrich their medical education through the presentation of their poster in a scientific conference.</p>			

Learning Outcomes	<p><u>Learning outcomes for all students:</u> After completion of the course students should be able to:</p> <ol style="list-style-type: none"> 1. Access, analyse and evaluate published research papers. 2. Develop and apply analytical and critical appraisal skills. 3. Develop self-directed learning skills. 4. Study, in depth, a topic of particular interest outside the core curriculum. 5. Describe the ethical issues relevant to writing a research paper including integrity, copyright and citation. 6. Demonstrate time management skills. 7. Consider potential career paths. <p><u>For students in Pathway A carrying out a Narrative Literature Review:</u> After completion of the course students should be able to:</p> <ol style="list-style-type: none"> 1. Describe the aims and structure of a Narrative Literature Review. 2. Discuss and critically appraise the literature. 3. Write a Narrative Literature Review at the level of a publication in an academic journal. 4. Describe how a Narrative Literature Review can support the development of research hypotheses and research proposals. <p><u>For students in Pathway B carrying a Research Project:</u> After completion of the course students should be able to:</p> <ol style="list-style-type: none"> 1. Implement an original Research Project (typically clinical research, audit or service evaluation) incorporating collection of quantitative or qualitative data 2. Collect data and analyse using suitable methods including simple descriptive statistics and graphs; 3. Discuss and critically appraise the study results in relation to the literature, recognising any limitations of the collected data, and drawn conclusions meeting the study aims 4. Design and produce a Research Poster suitable for display at a scientific conference that meets the published assessment criteria, written in plain English and accessible by a general professional audience including healthcare professionals, researchers and medical educationalists. 5. Describe the ethical issues relevant to writing a research paper including integrity, copyright and citation. 		
Prerequisites	None	Required	None
Course Content	<ul style="list-style-type: none"> • Introduction to the course. • The structure of the Narrative Literature Review. • Carrying out a Literature Review. • Critical appraisal of the literature. • Writing a Narrative Literature Review. • Carrying out an Original Research Project. • Constructing a scientific poster. • Presenting a scientific poster. 		
Teaching Methodology	Lectures, tutorials with Course Lead, self-directed learning.		
Bibliography	<p>PATHWAY A: Background reading on non-communicable diseases</p> <ol style="list-style-type: none"> 1. Noncommunicable diseases Factsheet. World Health Organisation. January 2015. 2. World Health Organization. Global Health Observatory (GHO): NCD mortality and 		

morbidity. Available from: http://www.who.int/gho/ncd/mortality_morbidity/
